Materials Impact Policy

The Stormking GRP formulations have a proven long track record of product performance, reliability and colour stability. This has enabled the company to offer a strong product proposition to its customers and has been an important factor in the company's commercial success.

In order to minimise the overall impact of its materials the company seeks to strike a balance between the environmental impacts of extracting its materials, the commercial viability of the Stormking formulation and the efficiency and safety of its own operations.

Policy

It is the policy of Stormking to minimise the environmental and health & safety impacts of its materials in the following ways:

- Comply with legal requirements (including REACH) concerning the composition of the Stormking formulation.
- Ensure that the Stormking production site is run in a clean efficient manner to minimise waste.
- Undertake regular environmental assessments of the company's supplier base and encourage all to achieve ISO14001 or equivalent.
- Move towards the introduction of post consumer recycled materials into the Stormking formulation as material supplies and technological developments permit.

The recycling of all GRP products and moulds at the end of their service life is the sustainability goal that Stormking is pursuing. Recycling reduces the energy required to produce new products, reduces the amount of virgin material that has to be manufactured and captures materials that might otherwise go to landfill. It is therefore sustainable in the true sense of the word.
